MAHARASHTRA

DEPARTMENT OF COMPUTER SCIENCE

<u>CERTIFICATE</u>

This is to certify that the project entitled, "ONLINE CAFÉ/RESTAURANT **MANAGEMENT SYSTEM"**, is bonafied work of SHREYA BHATTACHARJEE bearing Seat. No: 8213 submitted in partial fulfilment of the requirements for the award of degree of BACHELOR OF SCIENCE in COMPUTER SCIENCE from University of Mumbai.

Date: **External Examiner**

Internal Guide   **Coordinate/HOD**

College Seal

ACKNOWLEDGEMENT

I Miss Shreya Bhattacharjee Student of Pillai College of Arts, Commerce & Science, New Panvel would like to express my sincere gratitude towards our college's Computer Science Department.

I would like to thank lecturer Prof. Abhijeet Salvi, and for their constant support during the project. Last but not least I thank all my colleagues for being with me throughout the project, which leads to a successful completion of my project.

The project would not have been completed without creativity and energy, which our friends provided

Yours faithfully,

Shreya Bhattacharjee

(Final Year Computer Science)

TABLE OF CONTENTS

CHAPTER 1

1.1 INTRODUCTION

Online café/restaurant management is the process of ordering food, for [delivery](#) or pickup, from a website or other application. The product can be either ready-to-eat food (e.g., direct from a home-kitchen, restaurant, or a [ghost kitchen](#)) or food that has not been specially prepared for direct consumption (e.g., vegetables direct from a farm/garden, fruits, frozen meats. etc).

In restaurant-controlled online food ordering, the restaurants create their own website and app, or choose to hire a delivery vendor. If they choose to create their own website, they make sure to obtain software that manages the orders efficiently, meaning it has the capability to manage different orders at once.

Having an online ordering system can make day-to-day operations more efficient for a restaurant. On the other hand, when a customer places an order online, they take their time to browse the menu and get familiar with add-on deals and offers that your restaurant must be offering. Advantages of ordering online

1. **Makes the ordering process easier**
2. **Efficient customer and order management**

3. **Monitor your expenses incurred in real-time**

4. **. Better customers data**

1.2 BACKGROUND

The first online [food order](#) was a pizza from Pizza Hut in 1994.[2][3]

This is a picture from a 2018 Pizza Hut pizza box, which describes the first online food sale.

The online food ordering market has increased in the U.S with 40 percent of U.S adults having ordered their food online once.[4] The online food ordering market includes foods prepared by restaurants, prepared by independent people, and groceries being ordered online and then picked up or delivered In a 2019 market study of restaurant delivery services, the global market for online-ordered prepared food delivery was estimated at $94 billion and is estimated to grow at just over 9 percent a year, reaching $134.5 billion in 2023. Online ordering has started to become the norm, thanks to the convenience, accuracy, and ability to integrate payments. At scale, ubiquitous on-demand and subscription delivery of

prepared food could potentially spell the end of cooking at home.

1.3 OBJECTIVES

- The general objectives of the study is to develop a reliable, convenient and accurate Ordering System.

- The study has the following specific objectives:
- To develop a system that will surely satisfied the customer service.

- To evaluate its performance and acceptability in terms of security, user-friendliness, accuracy and reliability.
- To improve the communication between the client and the server and minimize the time of ordering.
    - To automatically compute the bill.

1.4 PURPOSE:

An online ordering and delivery system **provides a complete sales channel for the restaurant**. This means that the restaurant can use it as a tool for generating more profits and organizing the restaurant better. It also allows restaurant owners to save on labor costs and restaurant space needed to serve such customers.

The primary purpose of an online food ordering system is **to allow customers to easily place orders at a restaurant over the internet**.

With Food Aggregators increasing their commission every quarter, it is unsustainable for the restaurant to manage their restaurant while depending on food delivery orders from swiggy and zomato. The online ordering market is expanding and, especially the online food ordering segment is growing at a very rapid pace. Food Delivery is the preferred way for customers to enjoy food these days. This change has been roughly owed to the pandemic where customers prefer to order food online instead of dining out.

1.5 Scope

Food Ordering app can sale Food product, preferred brands, kitchen needs, essential restaurant supplies and more, through this online, one- stop Food store. It provides you with a convenient way to sale from your Food shopping app.

In such a technological era, people find it difficult to visit restaurants. Most often, they are unable to manage time for picking up their order. Therefore, most of them like to use the food delivery app. It provides them with the option to choose the menu as per their choice and place the order instantly with a few clicks.

It seems that with the advent of technologies, people have switched to the utilization of the easy-to-operate mobile app. This is why you find food delivery apps as one of those helping users to get the food at their doorsteps. However, the mobile app developed for food delivery also enables users to book a table, online delivery, and reservations. The availability of the restaurant apps helps restaurants to deliver quick services to their customer

1.6 APPLICABILITY:

This Website is applicable in field of business. It helps people to interact with each other through their business.

CHAPTER 2

.

FEASIBILITY STUDY

An important outcome of preliminary investigation is to determine whether the proposed system is feasible or not. A feasibility study is a test of a system proposal according to its work ability, ability to meet users need an effective use of resources. It is conducted to select the best system that meets the performance standards. It reviews the alternative solution and its objective is not solving the problem. Three key considerations are involved in feasibility analysis.

- ➢ Technical feasibility
- ➢ Economic feasibility
- ➢ Operational feasibility

1.Technical feasibility

In this study, a company's capabilities in terms of technical expertise are the main focus. This evaluation takes the outline of the system or project requirements into consideration.

When the technical feasibility study report is complete, the following factors are vital –

- A business description to evaluate additional factors that affect the study.
- The specific component/ division of the project/ business under assessment.
- The human resources and cost efficiency factors
- The possible or alternative solutions to the problems

  In our project we have used HTML ,CSS, JAVASCRIPT for our frontend language combining PHP and My SQL as our two major backend language with PHP performs the function and MYSQL providing the database we require to store the data of website. All this language are easy to used does not required any special training.

2. ECONOMIC FEASIBILITY

The purpose of an economic feasibility study is to demonstrate the net benefit of a proposed project for accepting or disbursing electronic funds/benefits, taking into consideration the benefits and costs to the agency, other state agencies, and the general public as a whole.

This project can help small scale offline shop owners as they can keep their website online 24/7 leading to great profits. This can also help in reduce the machine and manpower utilization which in turn saves time and money.

3.Operational feasibility

Operational feasibility assesses the extent to which the required software performs a series of steps to solve business problems and user requirements. This feasibility is dependent on human resources (software development team) and involves visualizing whether the software will operate after it is developed and be operative once it is installed. Operational feasibility also performs the following tasks. ✓ Determines whether the problems anticipated in user requirements are of high priority ✓ Determines whether the solution suggested by the software development team is acceptable ✓ Analyzes whether users will adapt to a new software ✓ Determines whether the organization is satisfied by the alternative solutions proposed by the software development team

STAKEHOLDERS

OWNER

Owner is the one who owns the company. He will always monitor what is happening in the system.

ADMIN

Admin is the one who controls all the data entered by the users in the website forms. Admin filters all the data received and provide genuine information to the customer. Therefore, the Admin has complete control over the website.
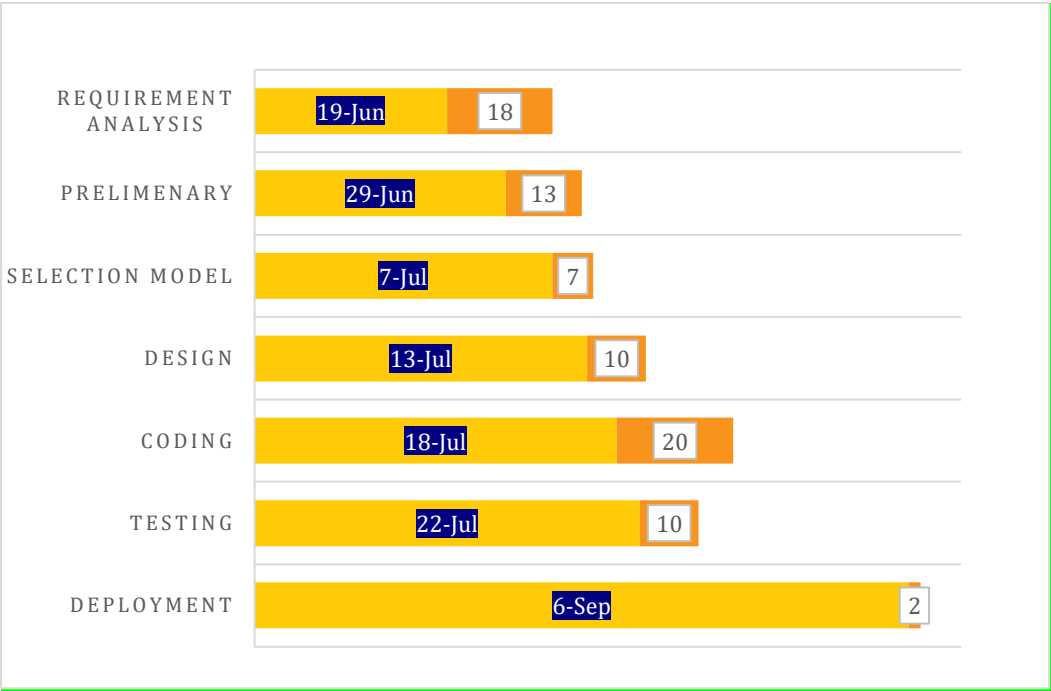

DEVELOPERS

Developer's areas stakeholders as they will keep on working on the project for future development. If any issues occur in the system, they will find the problem and try to find a solution for it.

USERS:Users are the ones who really matters in the successful run of the software. They are the ones who decide the future of the website.

CHAPTER 3: REQUIREMENT AND ANALYSIS

3.1 PLANNING AND SCHEDULING

REQUIREMENT ANALYSIS	19-Jun 18
PRELIMENARY	29-Jun 13
SELECTION MODEL	7-Jul 7
DESIGN	13-Jul 10
CODING	18-Jul 20
TESTING	22-Jul 10
DEPLOYMENT	6-Sep 2

3.2 SOFTWARE AND HARDWARE REQUIREMENTS

HARDWARE REQUREMENT

DEVELOPER SIDE

	PROCESSOR	RAM	DISK SPACE
CLIENT SIDE	1.6 GHz or Faster processor	1GB RAM	200 GB disk space
Server side	Server environment capable hardware	2GB RAM	As per size of the database

Software Requirement

Front end	Visual studio
Back end	MySQL
Operating system	MACOS,WINDOWS

3.3 CONCEPTUAL MODEL

1.ER DIAGRAM:

What is ER diagram?

ER Diagram stands for Entity Relationship Diagram, also known as ERD is a diagram that displays the relationship of entity sets stored in a database. In other words, ER diagrams help to explain the logical structure of databases. ER diagrams are created based on three basic concepts: entities, attributes and relationships.

ER Diagrams contain different symbols that use rectangles to represent entities, ovals to define attributes and diamond shapes to represent relationships.

At first look, an ER diagram looks very similar to the flowchart. However, ER Diagram includes many specialized symbols, and its meanings make this model unique. The purpose of ER Diagram is to represent the entity framework infrastructure.

The ER Model represents real-world entities and the relationships between them. Creating an ER Model in DBMS is considered as a best practice before implementing your database.

ER Modelling helps you to analyse data requirements systematically to produce a well-designed database. So, it

is considered a best practice to complete ER modelling before implementing your database.
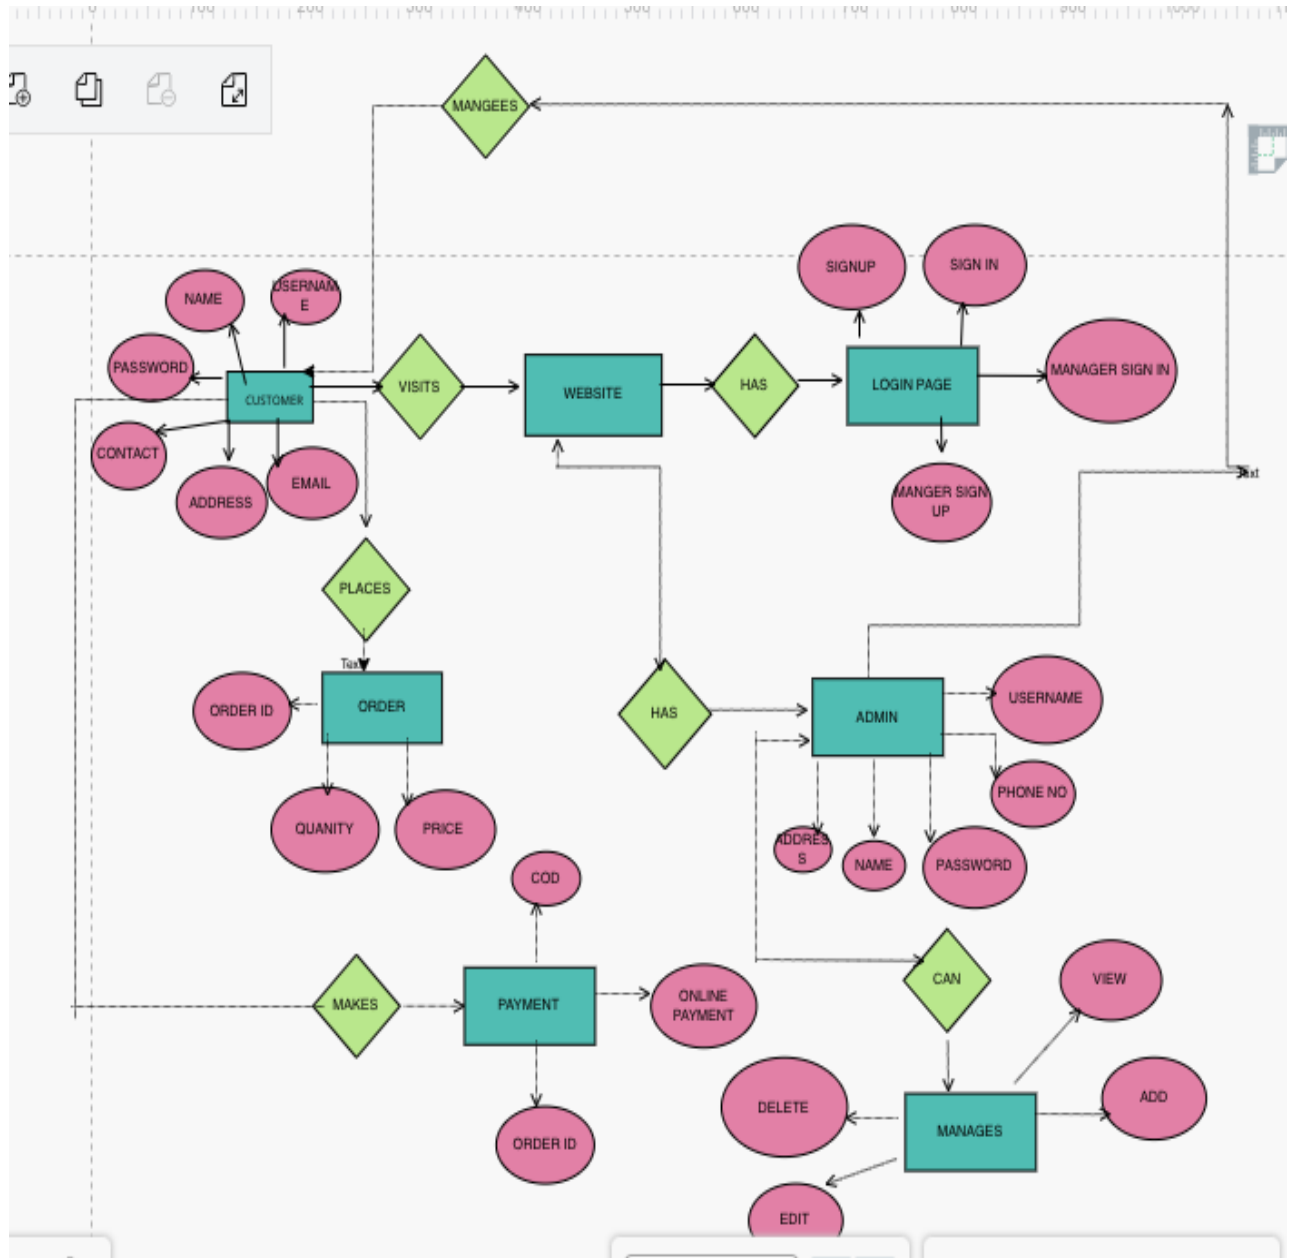

DATABASE DESIGN

The general theme behind a database is to handle information as an integrated whole. A database is a collection of interrelated data stored with minimum redundancy to serve many users quickly and effectively. After designing input and output, the analyst must concentrate on database design or how data should be organized around user requirements. The general objective is to make information access, easy quick, inexpensive and flexible for other users.

During database design the following objectives are concerned

✓ Data independence
✓ Accurate and integrating
✓ More information at low cost
✓ Recovery from failure
✓ Privacy and security ✓ Performance
✓ Ease of learning and use

2 CLASS DIAGRAM:

What is class diagram?

In software engineering, a class diagram in the Unified Modeling Language (UML) is a type of static structure diagram that describes the structure of a system by showing the system's classes, their attributes, operations (or methods), and the relationships among objects.

The class diagram is the main building block of object-oriented modeling. It is used for general conceptual modeling of the structure of the application, and for detailed modeling translating the models into programming code. Class diagrams can also be used for data modeling. The classes in a class diagram represent both the main elements, interactions in the application, and the classes to be programmed.

In the diagram, classes are represented with boxes that contain three compartments:

- The top compartment contains the name of the class. It is printed in bold and centred, and the first letter is capitalized.

- The middle compartment contains the attributes of the class. They are left-aligned and the first letter is lowercase.

- The bottom compartment contains the operations the class can execute. They are also left-aligned and the first letter is lowercase.

In the design of a system, a number of classes are identified and grouped together in a class diagram that helps to determine the static relations between them. With detailed modelling, the classes of the conceptual design are often split into a number of subclasses.

In order to further describe the behaviour of systems, these class diagrams can be complemented by a state diagram or UML state machine.
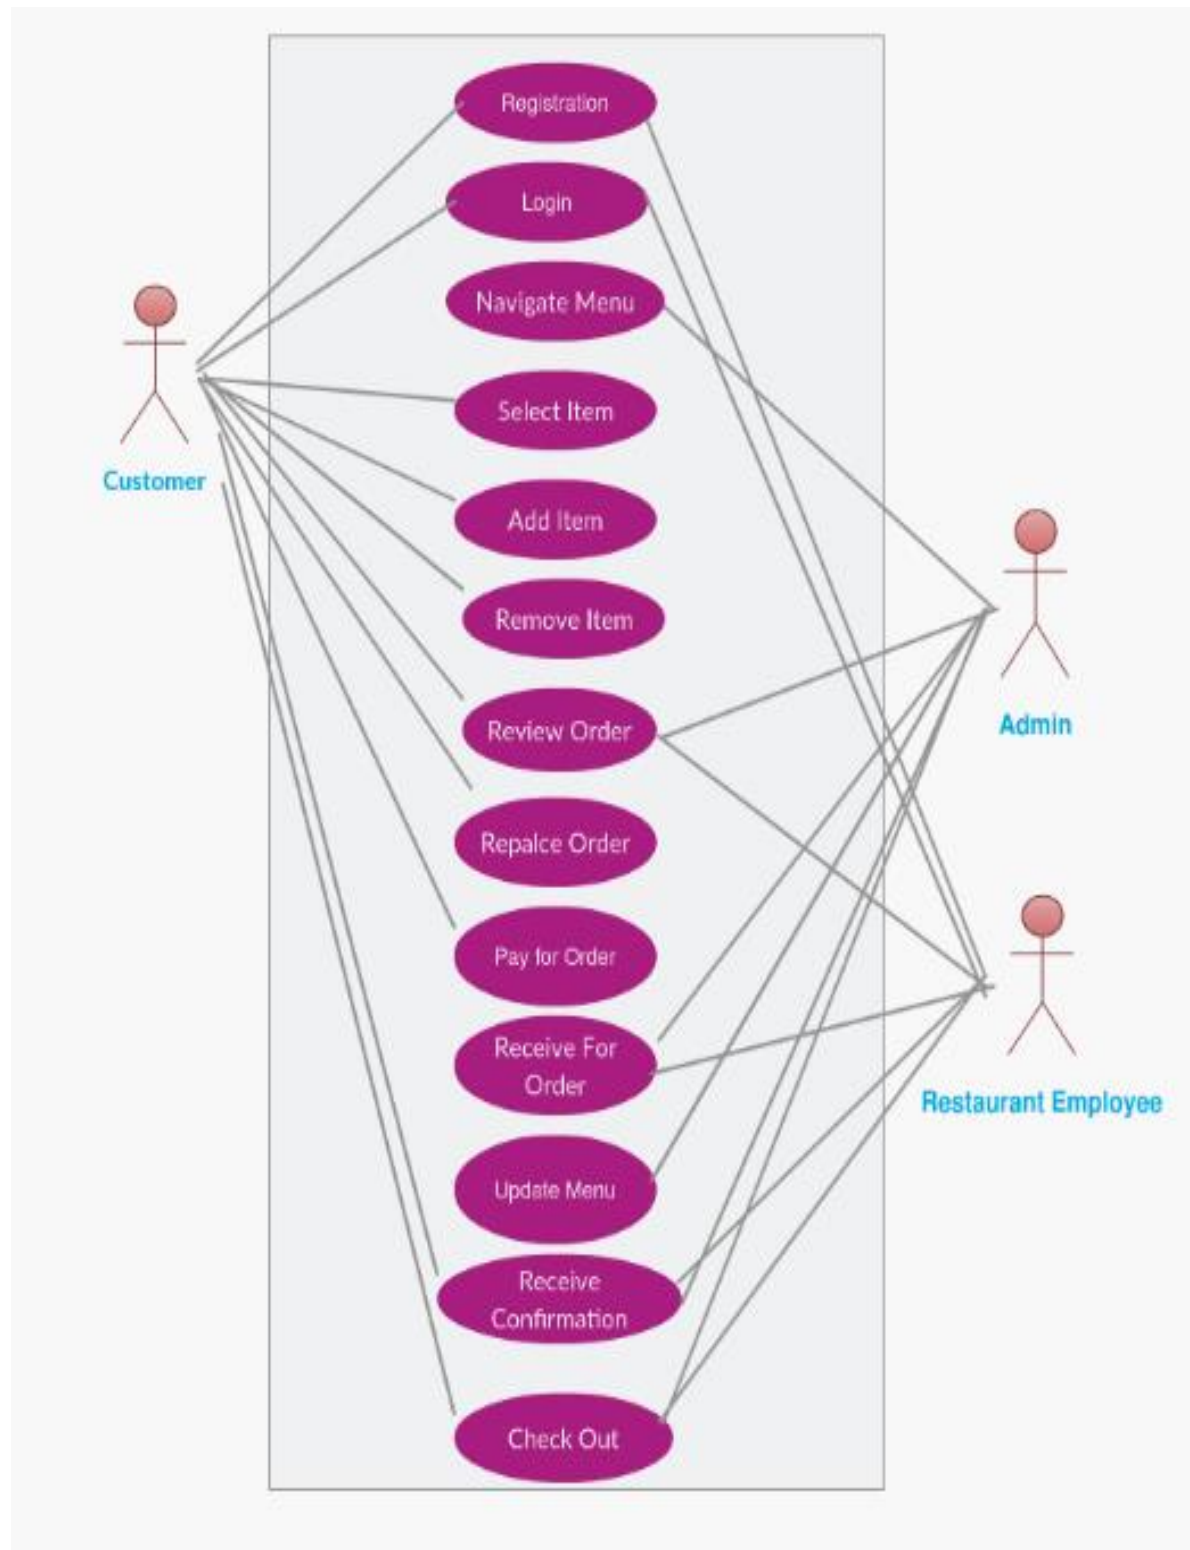

CLASS DIAGRAM
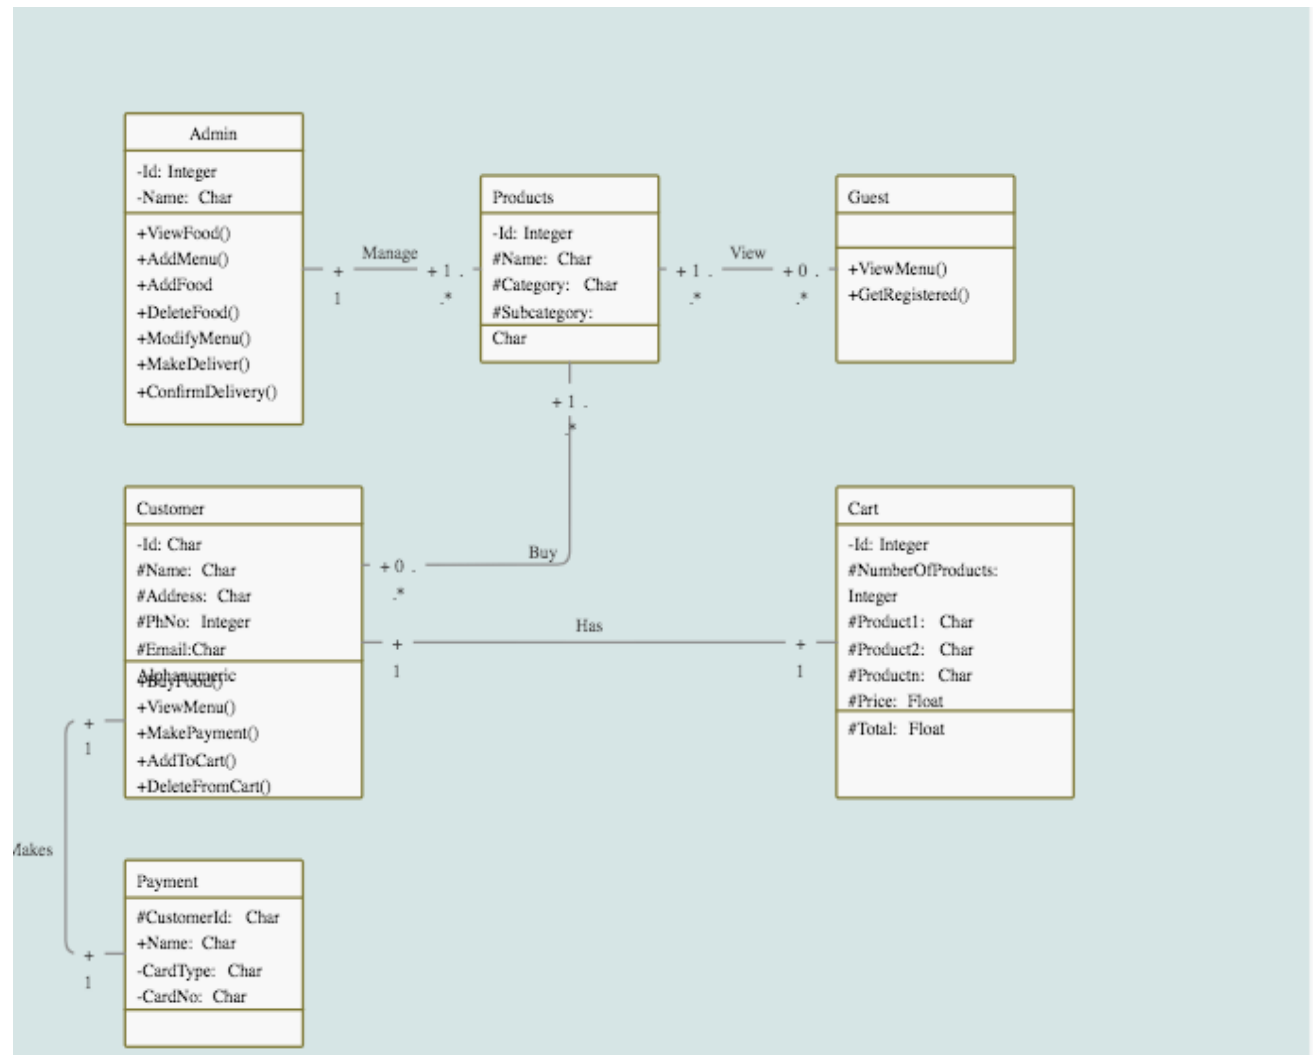

3.USE CASE DIAGRAM:

A use case diagram is a way to summarize details of a system and the users within that system. It is generally shown as a graphic depiction of interactions among different elements in a system. Use case diagrams will specify the events in a system and how those events flow, however, use case diagram does not describe how those events are implemented.

A use case is a methodology used in system analysis to identify, clarify, and organize system requirements. In this context, the term "system" refers to something being developed or operated, such as a mail-order product sales and service Web site. Use case diagrams are employed in UML (Unified Modelling Language), a standard notation for the modelling of real-world objects and systems. There are a number of benefits with having a use case diagram over similar diagrams such as flowcharts.

Use case diagram uses

The reasons why an organization would want to use case diagrams include:

- Represent the goals of systems and users.
- Specify the context a system should be viewed in.
- Specify system requirements.
- Provide a model for the flow of events when it comes to user interactions

Use Case	Actor
Registration	Customer
Login	Customer
Navigate Menu	Customer
Select Item	Customer
Add Item	Customer
Remove Item	Customer
Review Order	Customer, Admin
Repalce Order	Customer
Pay for Order	Customer
Receive For Order	Restaurant Employee
Update Menu	Admin
Receive Confirmation	Restaurant Employee
Check Out	Customer

4 ACTIVITY DIAGRAM:

We use Activity Diagrams to illustrate the flow of control in a system and refer to the steps involved in the execution of a use case. We model sequential and concurrent activities using activity diagrams. So, we basically depict workflows visually using an activity diagram. An activity diagram focuses on condition of flow and the sequence in which it happens. We describe or depict what causes a particular event using an activity diagram.

UML models basically three types of diagrams, namely, structure diagrams, interaction diagrams, and behaviour diagrams. An activity diagram is a behavioural diagram i.e., it depicts the behaviour of a system.

An activity diagram portrays the control flow from a start point to a finish point showing the various decision paths that exist while the activity is being executed. We can depict both sequential processing and concurrent processing of activities using an activity diagram. They are used in business and process modelling where their primary use is to depict the dynamic aspects of a system.

User side

Activity Diagram for User Side
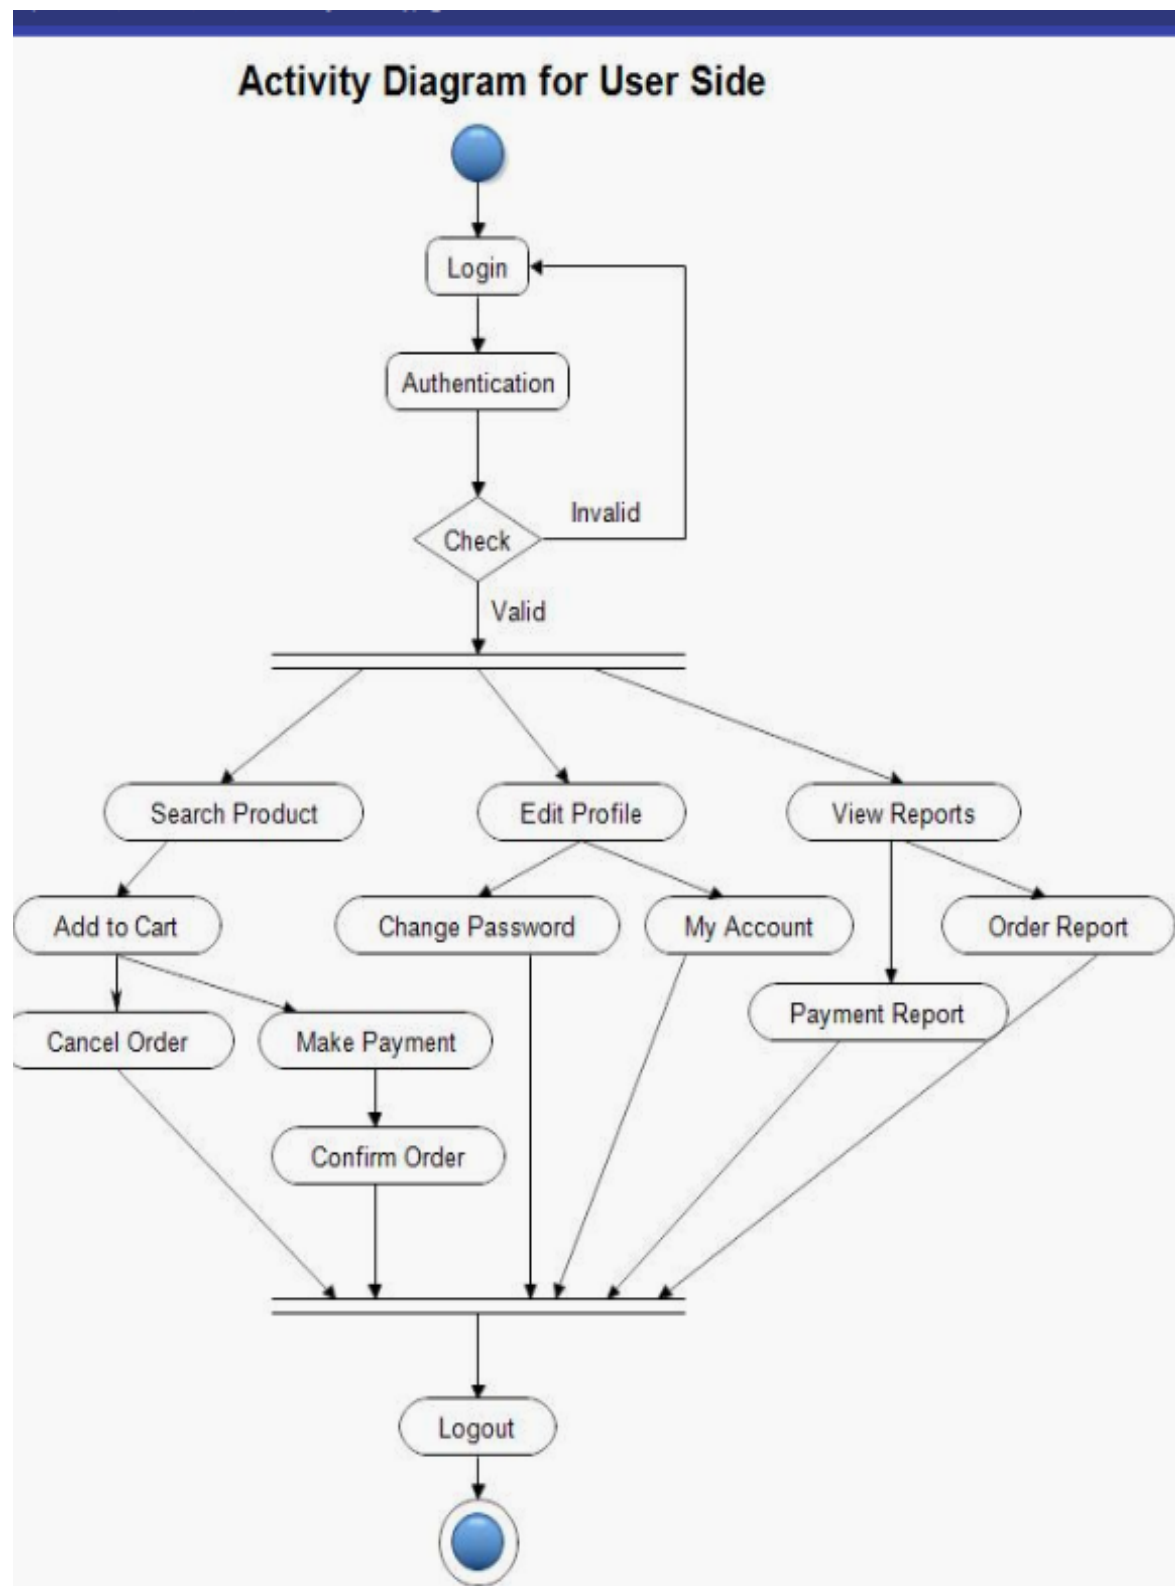

ADMIN SIDE(MANAGER SIDE)

Activity Diagram for Admin Side
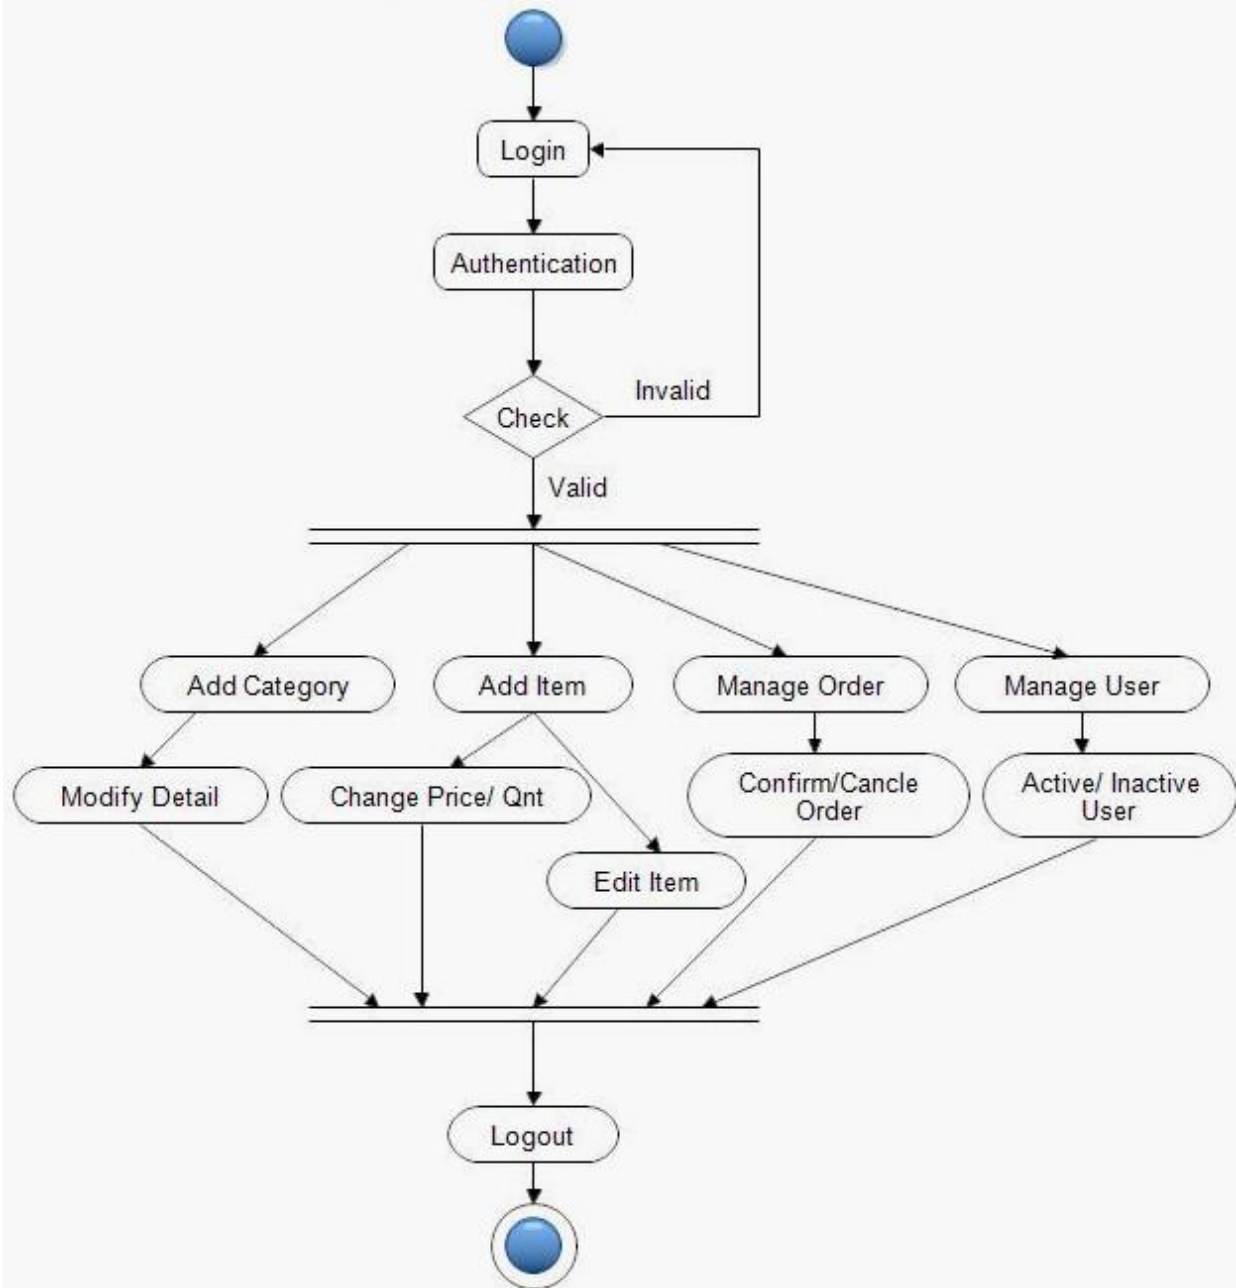

5 DEPLOYMENT DIAGRAM:

A deployment diagram is a UML diagram type that shows the execution architecture of a system, including nodes such as hardware or software execution environments, and the middleware connecting them.

Deployment diagrams are typically used to visualize the physical hardware and software of a system. Using it you can understand how the system will be physically deployed on the hardware.

Deployment diagrams help model the hardware topology of a system compared to other UML diagram types which mostly outline the logical components of a system.

Deployment Diagram Notations:

In order to draw a deployment diagram, you need to first become familiar with the following deployment diagram notations and deployment diagram elements.

Nodes:

A node, represented as a cube, is a physical entity that executes one or more components, subsystems or executables. A node could be a hardware or software element.
Artifacts:

Artifacts are concrete elements that are caused by a development process. Examples of artifacts are libraries, archives, configuration files, executable files etc.

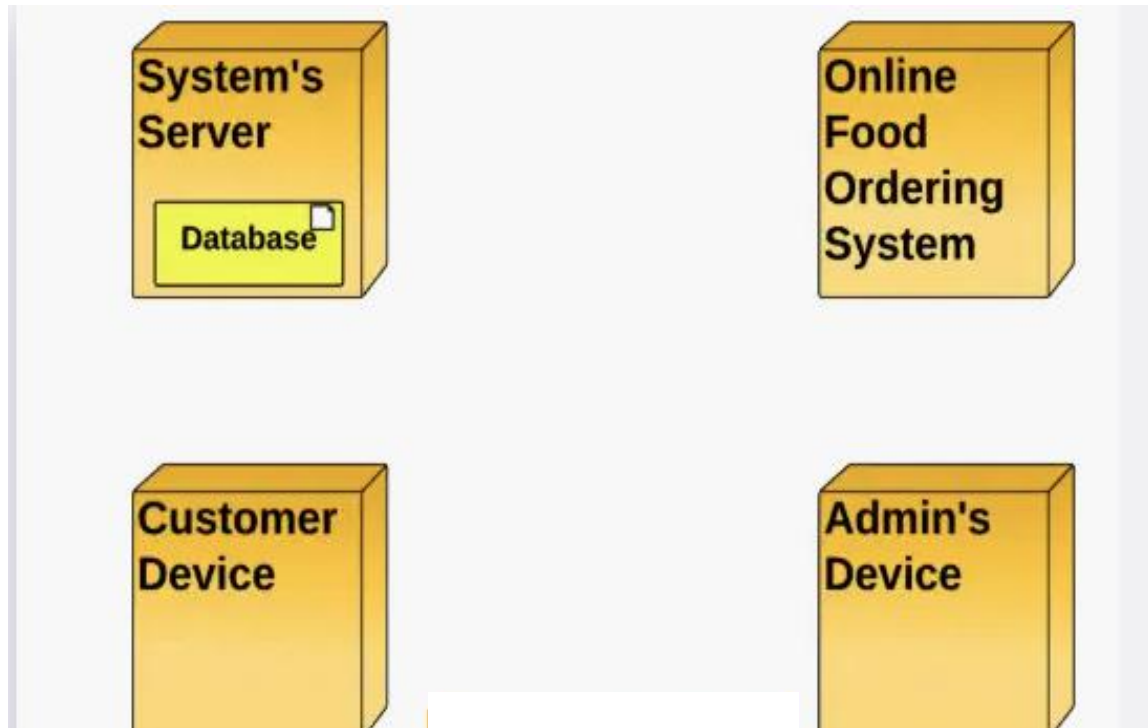

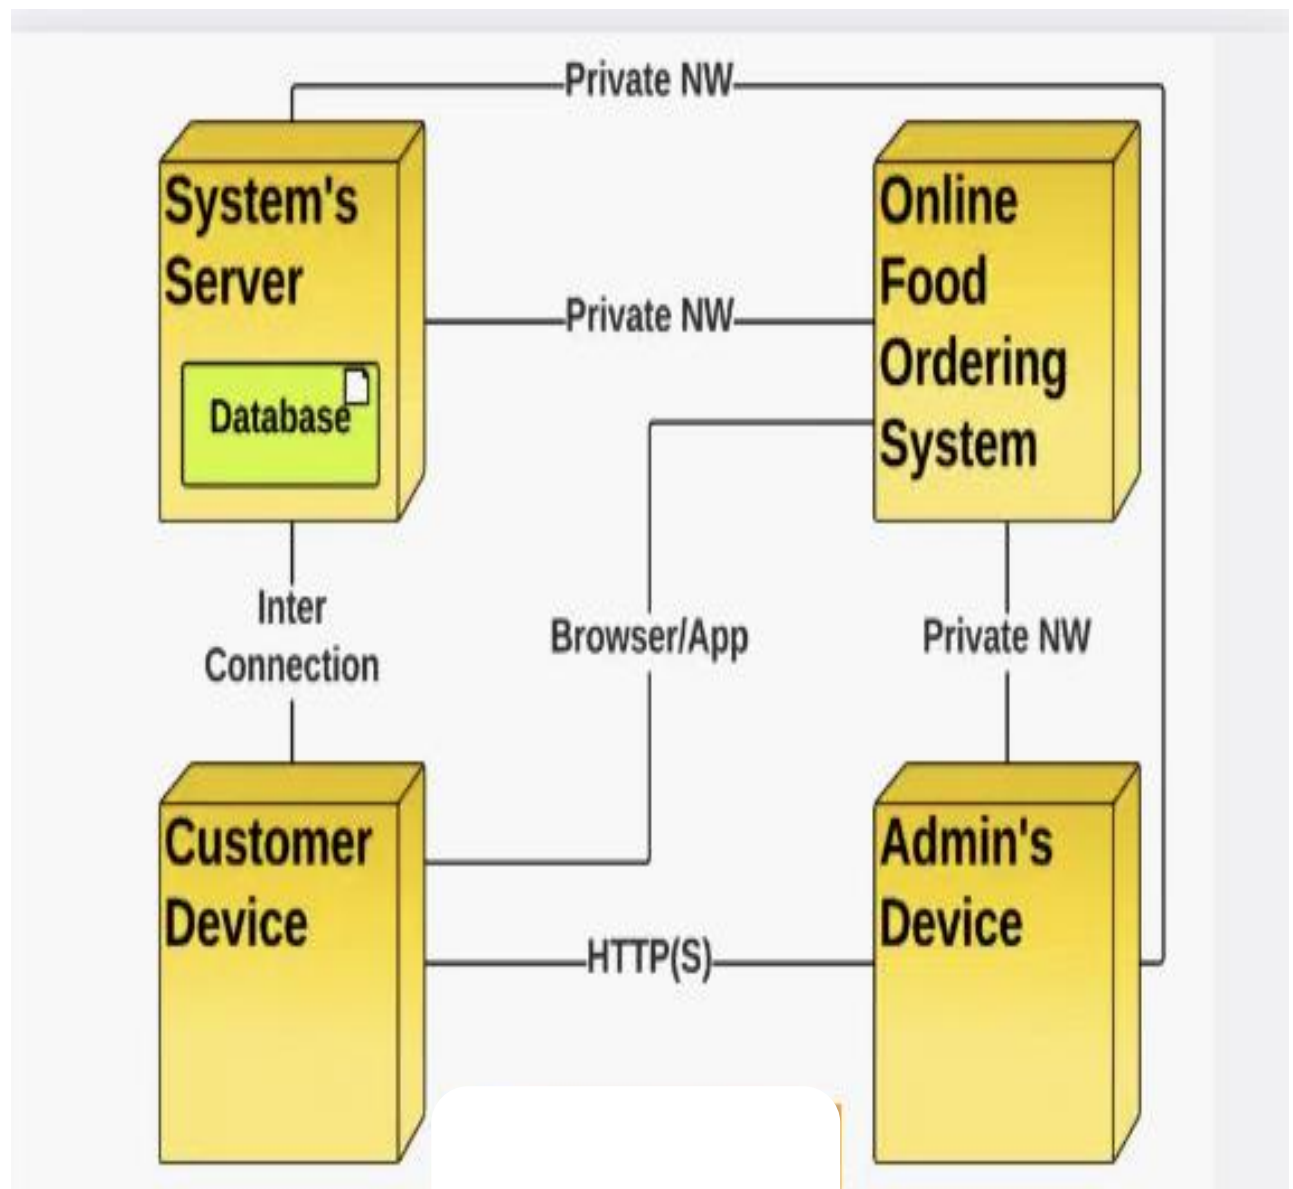

Communication Associates:

This is represented by a solid line between two nodes. It shows the path of communication between nodes.

DEPLOYMENT DIAGRAM

CHAPTER 4

SYSTEM DESIGN

INTRODUCTION TO SYSTEM DESIGN

The design phase is the life cycle phase in which the detailed design of the selected system in the study phase is accomplished. In the design phase, the technical specifications are prepared for the performance of all allocated tasks. It also includes the construction of programs and program testing. In the design phase, the first step is to determine the output is to be produced and in what format. Second, input data and master files have to be designed to meet the requirements of proposed output. The system analyst has to define the methods of capturing and input programs and format of the output and its use by the users.

SYSTEM FLOW CHART

A graphic representation of a system showing the overall flow of control in the processing at the job level; specifies what activities must be done to convert from a physical to logical model is known as a system flowchart. Thus it summarizes what operations are undertaken and where and when they take place. Normally in a system flowchart input from outside are shown to the left and outputs to the right. Symbols representing the operations undertaken

and the documents used are then placed in the appropriate places which gives a general flow of data from top to bottom and left to right. Arrows are used on the connecting lines to indicate the logical flow or sequence where the flow is not in the standard direction. No interaction is implied by crossing lines. Decisions which lead to different actions can also be shown

DATA FLOW DAGRAM

A data flow diagram is graphic representation of a system that shows data flows to, from and within the system, processing functions that change the date in some manner, and the storage of this data. They are networks of related system function that indicated form where information is revived and to where it is sent. An external entity is the originator or receiver of data or information.

DATABASE DESIGN

This activity deals with the design of the physical database. The designer begins to concentrate on file design or how data should be organized around user requirements. How data are organized depends on the data and response requirements that determine hardware configurations. An integrated approach to file design is the database. The general theme is to handle information as an integrated whole, with a minimum of redundancy and improved performance, type and size of data structure used. The objectives of data base are accuracy and integrity, privacy and security of data etc.

CODE DESIGN

Codes can provide brief identification of data items and replace longer descriptions that would be more awkward to store and to manipulate.

INPUT DESIGN

Input design is processing of converting the user oriented description of the inputs of the system. The goal of designing input data to make data entry as easy logical and free from errors as possible. In entering data, operates need to know the following. 1. The allocated space for each field. 2. Field sequence which must match that in the source document. 3. The format in which data fields are entered for example, filling out the data field is required through the edited format mm/dd/ yy

When we approach input data design, we design source documents that capture the data and then selected the media use to enter them into the computer. There are different ways in which data can be introduced into the system such as a. The data is converted into a machine sensible from by some realistic source document and types in the relevant items using a keyboard connected to the system. b. The document can be read directly by a machine and this converts information held in the human sensible form into a machine readable form without need for human investigations. c. Data entered into a system through a keyboard. This is done interactively by the person using the system. d. Data is presented in a form suitable to computer as a result of some of the processing. e. The data entry in the system has been designed so as to make to user friendly and also to incorporate certain validation checks. The field name must be documented.

The field name must be known to data entry operator or users so that the data entry will not exceed the allocated space.
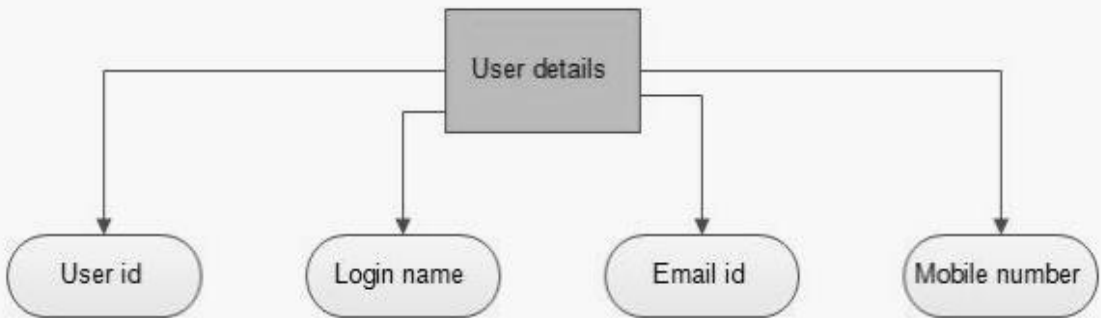

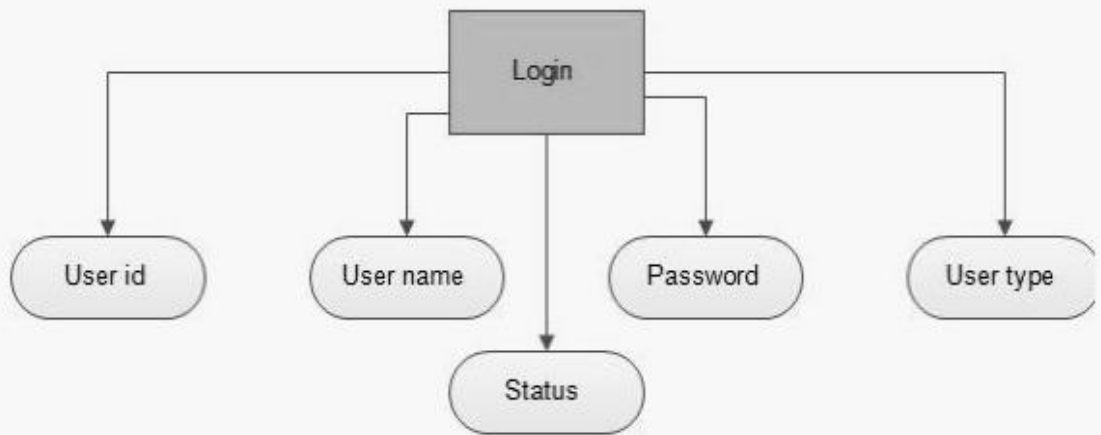

OUTPUT DESIGN

The primary consideration in the design of all output is the information requirement and other objective of the users. It is the most important and direct source of information to the user. A major form of output is a hard copy. Print out should be designed around the output requirements of the user. Each output should be given a specific name or title. The output data is displayed on the visual display unit and output can be redirected to printers and or sorted in a file for later use. Here, in this system, program is designed so as to generate a number of relevant outputs displayed in various kinds of user-defined tables in an easily readable and comprehensive manner which can be readily read and understood by the user.

PROCEDURE DESIGN

When program become very long, they are divided into smaller programs or modules. These smaller programs can be written, tested and debugged separately. This technique of programming is known as modular programming. The advantages of modular programming are. 1. It is easy to write, test and debug a module. 2. Generally the modules of common nature are prepared, which can be used at many places. 3. The programmer can use the previously written programs. 4. If a change is to be made, it is made in the particular module; the entire program is not affected.

SOURCE OR SINK

✓ Data cannot move directly from a source to a sink. It must be moved by a process. ✓ A source or sink has a noun phrase label. DATA FLOW ✓ A data flow has only one direction of flow between symbols. It may flow in both directions between a process and a data store to show a read before an update. ✓ A fork in a data flow means that exactly the same data goes from a common location to two or more different processes, data stores, or source/sinks. ✓ A join in a data flow means that exactly the same data come from any of two or more different processes, data stores, or source/sinks to a common location ✓ A data flow cannot go directly back to the same process it leaves. ✓ A data flow to a data store means update. ✓ A data flow from a data store means retrieve or use. ✓ A data flow has a noun phase label.

DATA FLOW DIAGRAM

The Data Flow Diagram (DFD) is the graphical representation of the processes and the flow of data among them. A data flow diagram illustrates the processes, data stores, external entities and the connecting data flows in a system. It is a common practice to draw a contextlevel Data Flow Diagram first which shows the interaction between the system and outside entities. A data flow diagram is a graphical tool used to describe and analyze movement of data through a system. They are the central tool and forms the basis from which the other components are developed. The transformation of data from input to output may be described logically and independently of physical components associated with the system. These are known as the logical data flow diagrams

TESTING

What is Software Testing?

Software testing is an activity to check whether the actual results match the expected results and to ensure that the software system is Defect free. It involves execution of a software component or system component to evaluate one or more properties of interest. Software testing also helps to identify errors, gaps or missing requirements in contrary to the actual requirements. It can be either done manually or using automated tools. Some prefer saying Software testing as a white box and Black Box Testing.

What is Software Testing Life Cycle (STLC)?

Software Testing Life Cycle (STLC) is defined as a sequence of activities conducted to perform Software Testing. It consists of series of activities carried out methodologically to help certify your software product. Diagram - Different stages in Software Test Life Cycle
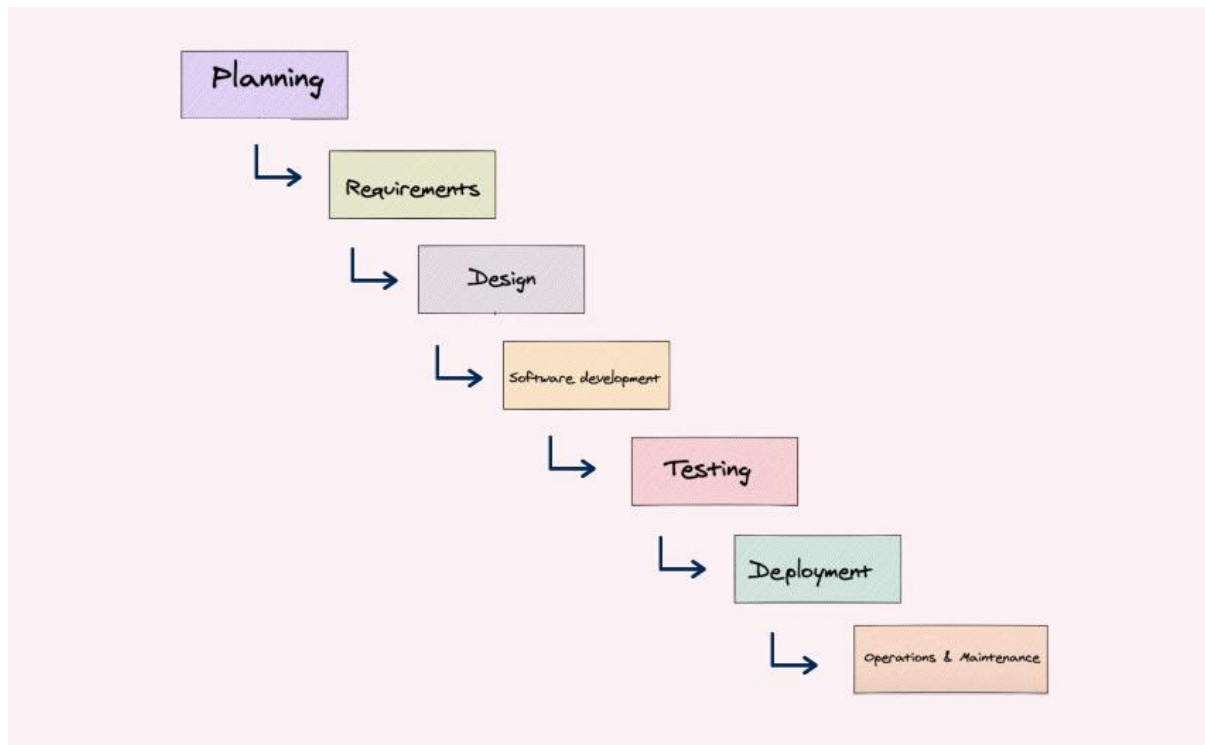

Software testing is the process of executing a program with intension of finding errors in the code. It is a process of evolution of system or its parts by manual or automatic means to verify that it is satisfying specified or requirements or not. Generally, no system is perfect due to communication problems between user and developer, time constraints, or conceptual mistakes by developer. To purpose of system testing is to check and find out these errors or faults as early as possible so losses due to it can be saved.

Testing is the fundamental process of software success. Testing is not a distinct phase in system development life cycle but should be applicable throughout all phases i.e. design development and maintenance phase. Testing is used to show incorrectness and considered to success when an error is detected

OBJECTIVES OF SOFTWARE TESTING

The software testing is usually performed for the following objectives

Software Quality Improvement

The computer and the software are mainly used for complex and critical applications and a bug or fault in software causes severe losses. So a great consideration is required for checking for quality of software.

Verification and Validation

Verification means to test that we are building the product in right way .i.e. are we using the correct procedure for the development of software so that it can meet the user requirements. Validation means to check whether we are building the right product or not.

Software Reliability Estimation

The objective is to discover the residual designing errors before delivery to the customer. The failure data during process are taken down in order to estimate the software reliability.

PRINCIPLES OF SOFTWARE TESTING

Software testing is an extremely creative and challenging task. Some important principles of software testing are as given:-

✓ All tests should be traceable to customer requirements.

✓ Testing time and resources should be limited i.e. avoid redundant testing.

✓ It is impossible to test everything.

✓ Use effective resources to test.

✓ Test should be planned long before testing begins i.e. after requirement phase

STRATEGY FOR SOFTWARE TESTING

Different levels of testing are used in the test process; each level of testing aims to test different aspects of the system. The First Level is unit testing. In this testing, individual components are tested to ensure that they operate correctly. It focuses on verification efforts. The Second Level is integration testing. It is a systematic technique for constructing the program structure. In this testing, many tested modules are combined into the subsystems which are then tested. The good here is to see if the modules can be integrated properly. The Third Level is integration testing? System testing is actually a series of different tests whose primary purpose is to fully exercise computer based system.

IMPLEMENTATION

A customer's web browser issues an HTTP request from the Contact page. On clicking the button, the content of the fields are posted from the customer's browser as a request to the web server. On receiving the request, the web server retrieves the file, Contacts.asp from its disk or memory and passes it to the php, php.dll, after processing the file php sends the HTML page to the server.

CHAPTER-6

FUTURE ENHANCEMENT

We think that not a single project is ever considered as complete forever. Because our mind is always thinking something new and our necessities also are growing day by day. We always want something more than what we have.

This project can be easily implemented under various situations. We can add new features as and when we require. Reusability is possible as and when require in this project. There is flexibility in all the modules. We can also include online payment services to this project using PayPal. This will help customers to pay online for their purchases using Credit/Debit card. There are many features which could be added to this project for making this project more productive.

FUTURE WORK

✓ **Customize orders: Allow customers to customize food orders** Enhance User Interface by adding more user interactive features. Provide Deals and promotional

✓ Offer details to home page. Provide Recipes of the Week/Day to Home Page

✓ Payment Options: Add different payment options such as PayPal, Cash, Gift Cards etc. Allow to save payment details for future use.

✓ Allow to process an order as a Guest

✓ Delivery Options: Add delivery option

CONCLUSION

The software development is never completed. There is always a need for modification. There could have been other approaches to implement the system. I have tried to my level best to make the

system an interactive as possible. The system has been developed with much care and free of errors and at the same time it is efficient and less time consuming. The purpose of this project was to develop a web application for purchasing items from a shop

CHAPTER-7

REFREENCES

BIBLIOGRAPHY

During the development of our system, we have taken the reference from Books and journals, which we would like to mention in this section.
These books acted as our tutors during the system development..
System Analysis And Design - Kenneth E. Kendall, Julie E. Kendall
An Analysis and Design of Information Systems –
Grayce M. Booth

Software Engineering - Roger S. Pressman Database Management System - James A. Larson
PHP: A Beginner's Guide - RiwantoMegosinarso
